1. (Math) Gaussian function is

\[ G(x, y; \sigma) = \frac{1}{2\pi\sigma^2} \exp \left( -\frac{x^2 + y^2}{2\sigma^2} \right) \]

The scale-normalized Laplacian of Gaussian (LOG) is

\[ \text{LoG} = \sigma^2 \nabla^2 G \]

Please verify that Difference of Gaussian (DOG)

\[ \text{DoG} = G(x, y; k\sigma) - G(x, y; \sigma) \]

can be a good approximation of LoG.

2. (Programming) Get two images, taken from the same scene but with scale transformations. Detect the scale invariant points on the two images. You can use the center of the circle to indicate the spatial position of the point and use the radius of the circle to indicate the characteristic scale of the point, just like the following example.

3. (Programming) Get two images \( I_1 \) and \( I_2 \) of our campus and make sure that the major parts of \( I_1 \) and \( I_2 \) are from the same physical plane. Stitch \( I_1 \) and \( I_2 \) together to get a panorama view using LoG based interest point detector and SIFT descriptor.
