Chapter 2
Understanding and Conceptualizing interaction
Recap

• HCI has moved beyond designing interfaces for desktop machines
• About extending and supporting all manner of human activities in all manner of places
• Facilitating user experiences through designing interactions
  • Make work effective, efficient and safer
  • Improve and enhance learning and training
  • Provide enjoyable and exciting entertainment
  • Enhance communication and understanding
  • Support new forms of creativity and expression
Today’s Topics

- Understanding the Problem Space and Conceptualizing Design
- Conceptual Models
- Interface Metaphors
- Interaction Types
- Paradigms, Theories, Models, and Frameworks
Today’s Topics

• Understanding the Problem Space and Conceptualizing Design
• Conceptual Models
• Interface Metaphors
• Interaction Types
• Paradigms, Theories, Models, and Frameworks
Understanding the problem space

– What do you want to create?
– What are your assumptions?
– Will it achieve what you hope it will?
What is an assumption?

- taking something for granted when it needs further investigation
  - e.g. people will want to watch TV while driving
What is a claim?

- stating something to be true when it is still open to question
  - e.g. a multimodal style of interaction for controlling GPS — one that involves speaking while driving — is safe
A framework for analysing the problem space

• Are there problems with an existing product or user experience? If so, what are they?
• Why do you think there are problems?
• How do you think your proposed design ideas might overcome these?
• If you are designing for a new user experience how do you think your proposed design ideas support, change, or extend current ways of doing things?
Activity

• What are the assumptions and claims made about 3D TV?
Assumptions: realistic or wish-list?

- People would not mind wearing the glasses that are needed to see in 3D in their living rooms
  - reasonable
- People would not mind paying a lot more for a new 3D-enabled TV screen
  - not reasonable
- People would really enjoy the enhanced clarity and color detail provided by 3D
  - reasonable
- People will be happy carrying around their own special glasses
  - reasonable only for a very select bunch of users
Benefits of conceptualising

- **Orientation**
  - enables design teams to ask specific questions about how the conceptual model will be understood

- **Open-minded**
  - prevents design teams from becoming narrowly focused early on

- **Common ground**
  - allows design teams to establish a set of commonly agreed terms
From problem space to design space

• Having a good understanding of the problem space can help inform the design space
  – e.g. what kind of interface, behavior, functionality to provide

• But before deciding upon these it is important to develop a conceptual model
Today’s Topics

• Understanding the Problem Space and Conceptualizing Design
• Conceptual Models
• Interface Metaphors
• Interaction Types
• Paradigms, Theories, Models, and Frameworks
Conceptual model

• A conceptual model is:
  – “a high-level description of how a system is organized and operates” (Johnson and Henderson, 2002, p 26)

• Enables
  – “designers to straighten out their thinking before they start laying out their widgets” (p 28)
Components

• Metaphors and analogies
  – understand what a product is for and how to use it for an activity

• Concepts that people are exposed to through the product
  – task-domain objects, their attributes, and operations (e.g. saving, revisiting, organizing)

• Relationship and mappings between these concepts
First steps in formulating a conceptual model

• What will the users be doing when carrying out their tasks?
• How will the system support these?
• What kind of interface metaphor, if any, will be appropriate?
• What kinds of interaction modes and styles to use?

always keep in mind when making design decisions how the user will understand the underlying conceptual model
Conceptual models

- Many kinds and ways of classifying them
- We describe them in terms of core activities and objects
- Also in terms of interface metaphors
Today’s Topics

• Understanding the Problem Space and Conceptualizing Design
• Conceptual Models
• Interface Metaphors
• Interaction Types
• Paradigms, Theories, Models, and Frameworks
Interface metaphors
Interface metaphors

- Conceptualizing what we are doing, e.g. surfing the web
- A conceptual model instantiated at the interface, e.g. the desktop metaphor
- Visualising an operation,
  - e.g. an icon of a shopping cart for placing items into
Activity

• Describe the components of the conceptual model underlying most online shopping websites, e.g.
  – Shopping cart
  – Proceeding to check-out
  – 1-click
  – Gift wrapping
  – Cash till?
Interface metaphors

• Interface designed to be similar to a physical entity but also has own properties
  – e.g. desktop metaphor, web portals
• Can be based on activity, object or a combination of both
• Exploit user’s familiar knowledge, helping them to understand ‘the unfamiliar’
• Conjures up the essence of the unfamiliar activity, enabling users to leverage of this to understand more aspects of the unfamiliar functionality
Benefits of interface metaphors

- Makes learning new systems easier
- Helps users understand the underlying conceptual model
- Can be very innovative and enable the realm of computers and their applications to be made more accessible to a greater diversity of users
Problems with interface metaphors

• Break conventional and cultural rules – e.g. recycle bin placed on desktop
• Can constrain designers in the way they conceptualize a problem space
• Conflict with design principles
• Forces users to only understand the system in terms of the metaphor
• Designers can inadvertently use bad existing designs and transfer the bad parts over
• Limits designers’ imagination in coming up with new conceptual models
Today’s Topics

- Understanding the Problem Space and Conceptualizing Design
- Conceptual Models
- Interface Metaphors
- **Interaction Types**
- Paradigms, Theories, Models, and Frameworks
Interaction types

• Instructing
  – issuing commands and selecting options

• Conversing
  – interacting with a system as if having a conversation

• Manipulating
  – interacting with objects in a virtual or physical space by manipulating them

• Exploring
  – moving through a virtual environment or a physical space
1. Instructing

- Where users instruct a system and tell it what to do
  - e.g. tell the time, print a file, save a file
- Very common conceptual model, underlying a diversity of devices and systems
  - e.g. word processors, VCRs, vending machines
- Main benefit is that instructing supports quick and efficient interaction
  - good for repetitive kinds of actions performed on multiple objects
Which is easiest and why?
2. Conversing

• Underlying model of having a conversation with another human

• Range from simple voice recognition menu-driven systems to more complex ‘natural language’ dialogs

• Examples include timetables, search engines, advice-giving systems, help systems

• Also virtual agents, toys and pet robots designed to converse with you
Would you talk with Anna?

Welcome to IKEA. I'm Anna, IKEA USA's Online Assistant. You can ask me about IKEA and our products and our services. I'll answer your questions, sometimes opening up relevant web pages along the way. Your inputs will be used to improve and expand my knowledge base. Thanks very much.
Pros and cons of conversational model

- Allows users, especially novices and technophobes, to interact with the system in a way that is familiar
  - makes them feel comfortable, at ease and less scared

- Misunderstandings can arise when the system does not know how to parse what the user says
3. Manipulating

- Involves dragging, selecting, opening, closing and zooming actions on virtual objects
- Exploit’s users’ knowledge of how they move and manipulate in the physical world
- Can involve actions using physical controllers (e.g. Wii) or air gestures (e.g. Kinect) to control the movements of an on screen avatar
- Tagged physical objects (e.g. balls) that are manipulated in a physical world result in physical/digital events (e.g. animation)
Direct Manipulation

- Shneiderman (1983) coined the term DM, came from his fascination with computer games at the time
  - Continuous representation of objects and actions of interest
  - Physical actions and button pressing instead of issuing commands with complex syntax
  - Rapid reversible actions with immediate feedback on object of interest
Why are DM interfaces so enjoyable?

• Novices can learn the basic functionality quickly
• Experienced users can work extremely rapidly to carry out a wide range of tasks, even defining new functions
• Intermittent users can retain operational concepts over time
• Error messages rarely needed
• Users can immediately see if their actions are furthering their goals and if not do something else
• Users experience less anxiety
• Users gain confidence and mastery and feel in control
What are the disadvantages with DM?

- Some people take the metaphor of direct manipulation too literally
- Not all tasks can be described by objects and not all actions can be done directly
- Some tasks are better achieved through delegating
  - e.g. spell checking
- Can become screen space ‘gobblers’
- Moving a mouse around the screen can be slower than pressing function keys to do same actions
4. Exploring

- Involves users moving through virtual or physical environments

- Physical environments with embedded sensor technologies
  - Context aware
Which conceptual model is best?

- Direct manipulation is good for ‘doing’ types of tasks, e.g. designing, drawing, flying, driving, sizing windows.
- Issuing instructions is good for repetitive tasks, e.g. spell-checking, file management.
- Having a conversation is good for children, computer-phobic, disabled users and specialised applications (e.g. phone services).
- Hybrid conceptual models are often employed, where different ways of carrying out the same actions is supported at the interface - but can take longer to learn.
Conceptual models: interaction and interface

• **Interaction type:**
  - what the user is doing when interacting with a system, e.g. instructing, talking, browsing or other

• **Interface type:**
  - the kind of interface used to support the mode, e.g. speech, menu-based, gesture
Many kinds of interface types available...

- Command
- Speech
- Data-entry
- Form fill-in
- Query
- Graphical
- Web
- Pen
- Augmented reality
- Gesture

(for more see chapter 6)
Which interaction type to choose?

- Need to determine requirements and user needs
- Take budget and other constraints into account
- Also will depend on suitability of technology for activity being supported
- This is covered in course when designing conceptual models
Today’s Topics

• Understanding the Problem Space and Conceptualizing Design
• Conceptual Models
• Interface Metaphors
• Interaction Types
• Paradigms, Theories, Models, and Frameworks
Paradigm

• Inspiration for a conceptual model
• General approach adopted by a community for carrying out research
  – shared assumptions, concepts, values, and practices
  – e.g. desktop, ubiquitous computing, in the wild
Examples of new paradigms

- Ubiquitous computing (mother of them all)
- Pervasive computing
- Wearable computing
- Tangible bits, augmented reality
- Attentive environments
- Transparent computing
  - and many more....
Theory

• Explanation of a phenomenon
  – e.g. information processing that explains how the mind, or some aspect of it, is assumed to work

• Can help identify factors
  – e.g. cognitive, social, and affective, relevant to the design and evaluation of interactive products
Models

• A simplification of an HCI phenomenon
  – intended to make it easier for designers to predict and evaluate alternative designs
  – abstracted from a theory coming from a contributing discipline, e.g. psychology, e.g. keystroke model
Framework

• Set of interrelated concepts and/or specific questions for ‘what to look for’

• Many in interaction design
  – e.g. Norman’s conceptual models, Benford’s trajectories

• Provide advice on how to design
  – e.g. steps, questions, concepts, challenges, principles, tactics and dimensions

Table 2.1 A new framework for human–computer interaction (Rogers, 2009)
Summary

• Important to have a good understanding of the problem space
• Fundamental aspect of interaction design is to develop a conceptual model
• Interaction modes and interface metaphors provide a structure for thinking about which kind of conceptual model to develop
• Interaction styles are specific kinds of interfaces that are instantiated as part of the conceptual model
• Paradigms, theories, models and frameworks can also shape a conceptual model
